Project Name : TrainOn

Many people face the problem of isolation and lack of motivation when trying to incorporate exercise into their daily lives. Through our platform, we address this problem by providing a network of support and connectivity that fosters collaboration, community, and solidarity among practitioners.

The proposed services include a gym and fitness search platform where users can find gyms in their area based on their preferences, such as equipment, services and cost. In addition, the platform offers the ability to find fitness partners with similar interests and goals, promoting the creation of a supportive community environment. The product/service is a comprehensive online fitness community platform that offers tools and resources to encourage and support people in meeting their fitness goals.

Our application also provides the possibility for gymnasts to create profiles to which they will post paid content. Users who have subscribed to the profiles will have access to personalized nutrition plans, tips, as well as videos. In addition, personalized training programs are provided that are designed with each user's individual needs and goals in mind.

The main innovation of the platform is the integration of various fitness-related services into a single integrated environment. This integrated approach creates a more cohesive and user-friendly environment for users, making the fitness experience more enjoyable, encouraging the successful achievement of their fitness goals.
